

Technology for an Easy Life?

Nowadays, the world is just a click away. A 2016 study¹ shows that the average person in the United States touches a smartphone **screen** 2,617 times per day. Today, people use smartphones, smartwatches, and even smartglasses to interact with the world and do all of their daily work. Robots, like Apple's Siri, can answer their questions, and robots, like the Roomba, can clean their houses. In the near future, smart cars will drive people to work, and smart refrigerators will order food **online**. In the future, cars might fly and robots might think for themselves. Robot technology will do all of the work, and people will be able to relax.

Or will they? This future might be easier, but will it be more dangerous? Experts say that people have to **be careful** with their personal information. Technology users should **save** important **files** in many locations, and **protect** their personal information, such as passwords and credit card numbers, from thieves who might want to **steal** them. Users of social media sites such as Facebook and Twitter have to be careful not to share private information with everyone on the internet. Technology will be able to solve many old problems, but might cause many new ones.
